

Short panels

Logistic solution for export markets

Silos with short panels for export

Unlike the regular silos with 3,05 meter long panels, the export silo consists of 2,24 meter short steel sheets which can be loaded transversely in either truck or container. Transport costs can be reduced considerably since up to 25% less loading space is occupied.

The export silo can be shipped shrink-wrapped on pallets or packaged as a complete export-kit in special, stackable cardboard boxes so transport efficiency increases even more.

The export-kit contains corrugated steel short panels, bolts and nuts, liner, wall- & bottom protection and an optional anti-algae cover.

Benefits:

- Increased rigidity due to shorter panels
- Optimum filling rate trucks and containers
- Reduced transport cost per system
- Easier handling when loading – unloading truck or container
- Up to 30% less weight per panel; easier manual installation
- Despite more panels, minor impact on assembly time
- Export-kit fits complete systems up to
- Ø 11 meter in one box
- Box packaging in compliance with ISPM15
