

Mixing Hatch

Genap Mixing Hatch

The mixing hatch is designed to be fit into floating liners in slurry tanks and lagoons. It includes a foam board hatch and is available in various standard sizes as well as made-to-order sizes. The hatch is often used for access to mixers on a winch stand.

Another application in a system in combination with a submersible mixer.

Standard sizes: 1.5x1.0 metres; 2.0x1.5 metres.

Due to the rectangular shape, the hatch can also be retrofitted into existing floating covers.

Made-to-order sizes are available on request.

Technical description:

The floating body consists of a 150mm PE pipe welded to a rectangular frame. PE strips on the side of the pipe are used to clamp the liner to the floating cover. The hatch is secured to the frame using PE strips and a film strip serving as a hinge. The hatch is operated by a simple rope.
